

THE DOZER

popular science *Classic*
"Space-Age Ice Scraper"

The Essential Tool for Safe Winter Driving

**Lifetime
Warranty**

MADE IN USA

The **IceDozer™** is backed by a Lifetime Warranty, so don't hesitate to contact me directly if you have any problems or complaints. Of course if you're satisfied, I'd be glad to receive testimonials – including any photos – which you might like to share.

Instructions For Use

Multiple Hand Grips

The **IceDozer™** is scientifically designed to amplify the natural strength and motion of the upper body. Grasp the product in the **Two-Fisted PowerGrip™** by taking hold of the rear **Saw Handle™** with your preferred hand while folding your other hand around the **Front Grip™**.

Use of the FlexiBlade

The unique flexible scraping blade automatically adjusts to the contours of ANY windshield when downward pressure is applied to either the front grip or the strut grip of the **IceDozer™**. This allows the full 7" width of the **FlexiBlade™** surface to contact the windshield during the ice-clearing process, thus maximizing effectiveness while reducing the time spent out in the cold.

Multiple Attack Surfaces

The **IceDozer™** comes equipped with three powerful attack Surfaces. The finely honed **Frost-Peeler Blade™** takes™ aim at stubborn frost while the forward facing **IceBreakerTeeth™** concentrate the cracking force when tackling thicker ice. The carbide-teeth style **Tenderizers™** on the bottom of the **IceDozer™** are designed to exploit the Achilles Heel of ice - its brittleness.

Always Start by Tenderizing

If your car windows are covered in a significant layer of ice (or even crusted snow) then the first thing to do is to **Tenderize™** the icy surface. Grasp the **IceDozer™** in the **Power Grip™** and proceed to tap sharply downward onto the ice, this creates hairline fractures in the ice cover which disrupts its adhesive grip on the windshield. The more time you spend tenderizing the easier it will be to rip the ice from the surface of the glass.

Three Ways to Remove Ice

For Frost and Very Thin Ice

Use a Medium Angle of Attack to apply the FrostPeeler Blade™

For Frost and Very Thin Ice

Hold the **SawHandle™** rear grip at a medium angle of attack (relative to the surface of the ice). This brings the finely honed **FrostPeeler Blade™** into play which you'll need to peel away this painted-on ice coating.

For a Moderate Ice Buildup

Use a High Angle of Attack to apply the IceBreaker Teeth™

For Moderate Ice Buildup

Hold the **IceDozer™** at a high angle (relative to the surface). This brings the **IceBreaker Teeth™** into play which concentrates the force to crack brittle ice and crusty snow as you move forward.

For Really Thick Ice

Use a Low Angle of Attack to apply the Tenderizer Teeth™

For a Really Thick Ice Buildup

Hold the **SawHandle™** at a low angle. This exposes the carbide-style **Tenderizer Teeth™**. Move the **IceDozer™** back and forth in a sawing motion to rip the ice from the windshield. If it is very cold and the ice is brittle, try tapping sharply downward onto the ice a few times in order to **Tenderize** the ice.™
